Account Access, Identity, and Sign-In Support

FICTIONAL TRAINING DOCUMENT — designed for RAG/agent testing; no real company, policy, SLA, customer, or price is represented.

Scope, identifiers, and security

Support owns first-line diagnosis of password, MFA, SAML SSO, SCIM, account lockout, invitation, and administrator-access problems. Billing owns payment/suspension status; Technical owns confirmed service defects and broad authentication outages.

Never request passwords, recovery codes, API secrets, private keys, webhook secrets, or full card numbers.

ID	Example	Use
Account	ACC-482193	Tenant identifier
User	USR-019284	Affected identity
Case	SUP-2026-10482	Support tracking
Workspace	acme-eu	Tenant/region context

Password reset and lockout

Reset links expire after 30 minutes and after first successful use. Maximum: five reset emails per user per 60 minutes. Ten failed password attempts within 15 minutes trigger a 30-minute password lock. A successful reset clears a password lock but does not fix SSO-controlled access.

- Confirm regional login endpoint and exact account email; check spam/quarantine and notification-service health before repeated resends.
- If email changed recently, verify which identity remains active. Reset-email delays over 10 minutes should be checked against notification status.
- For enterprise SSO users, determine whether failure occurs before redirect, at the identity provider, or after return to Northstar.

MFA recovery

Situation	Action
Old authenticator available	Enroll new device, verify, remove old device.
Recovery code available	Use code, then enroll new authenticator.
Lost device/no code	Identity verification + workspace-admin approval.
All admins locked out	Priority recovery; Support lead + Security review.

SSO error reference

Code	Meaning
SSO-101	Required email claim missing
SSO-203	Assertion audience/entity ID mismatch
SSO-311	Signing certificate expired/not yet valid
SSO-420	Authenticated user not mapped to active workspace member

SCIM, ownership, and enterprise access

SCIM propagation is normally under 10 minutes. Deactivation blocks interactive access but preserves historical references according to retention policy. Delete/recreate with the same email can produce a new User ID. Workspace ownership is normally transferred by the current Owner; if the Owner left, require an existing Admin plus organization-domain verification. Enterprise designated contacts may participate in verification.

Roles and common permission failures

Symptom	Likely cause / check
Signed in, no workspace	Wrong workspace slug or deactivated membership.
Not authorized on one project	Missing project/team membership.
Admin cannot view invoices	Admin lacks Billing Admin role.
Many users lose permission simultaneously	Check policy/audit change; possible Technical escalation.
New SCIM user lacks group access	Check provisioning event, mapping, and sync delay.

Severity and escalation

Condition	Severity / route
One user blocked; workaround exists	Sev 4 — Support
Multiple users blocked	Sev 3 — Support; tenant configuration first
Most tenant users cannot authenticate	Sev 2 — Technical escalation
Multi-region authentication outage	Sev 1 — incident process

Ticket evidence

• Account ID, affected User IDs, workspace slug and region.

• UTC timestamp/timezone, auth method, exact error code, sanitized screenshot.

• Whether another user in the same workspace succeeds.

• Recent certificate, domain, email, SSO, SCIM, administrator, or policy changes.

Decision examples

Reset email absent: verify email, notification health, quarantine, then resend once; remains Support. **Forty users get SSO-311 after certificate rotation:** collect certificate-change timestamp and tenant identifiers, escalate Sev 2 to Technical. **Login blocked because account is financially suspended:** Billing restores commercial status first; Support handles any remaining authentication issue.

Customer-safe handling

Explain verified behavior and next actions without exposing internal hostnames, employee data, raw security logs, credentials, or speculative root cause. If a customer pasted a secret into a case, instruct them to rotate it and avoid copying the secret into escalation notes.
