Customer Support Operations and Case Management

Support Agent | Knowledge Base 2026.10 | Primary retrieval domain: Support Agent

FICTIONAL TRAINING DOCUMENT — designed for RAG/agent testing; no real company, policy, SLA, customer, or price is represented.

Channels, hours, and case intake

Portal and email are standard channels; eligible Enterprise accounts may have an emergency production channel. Business-hours support: Monday-Friday 08:00-18:00 CET, excluding company holidays. Sev 1 production incidents are handled 24x7.

• Required: organization/contact, Account ID, expected vs actual behavior, business impact, first-observed timestamp, environment/region, relevant User/Job/Request/Invoice IDs, and troubleshooting already performed.

Priority model

Priority	Impact	First response
P1	Production unavailable, broad login failure, credible data-loss risk	30 min, 24x7
P2	Major feature unavailable to many users; no reasonable workaround	2 business hours
P3	Limited functional/configuration issue	1 business day
P4	How-to, cosmetic, feature guidance	2 business days

Priority is based on verified impact, not the label requested by the customer. Document the reason for any priority adjustment.

Lifecycle

New → Investigating → Waiting on Customer → Escalated → Monitoring → Resolved → Closed. Waiting-on-Customer cases receive a reminder after three business days and may close after seven business days without response; P1/P2 incidents are not auto-closed.

Routing

Question	Owner
Password/access/how-to	Support
Invoice/refund/payment/plan charge	Billing
API error/outage/latency/webhook	Technical
Outage credit eligibility/value	Billing after Technical verifies incident
Paid invoice but still suspended	Billing first; Support/Technical if access remains broken

Handoffs and duplicate incidents

Link duplicate reports to a parent incident after a shared issue is confirmed; keep customer-specific symptoms, contractual questions, and confidential details in child cases. A handoff should prevent the customer from repeating basic information.

Escalation package

• Case and Account IDs; region/environment/feature; impact and priority rationale.

• Exact timestamps, request/job/delivery IDs, endpoint names and error codes.

• Sanitized logs/screenshots, recent deployment/configuration changes, attempted steps and outcomes.

Communication cadence

Priority	Customer update cadence
P1	Every 30 minutes until stable; hourly during monitoring
P2	At least every 2 business hours while actively investigated
P3/P4	On meaningful progress; at least once/business day during internal work
Waiting on Customer	No daily repetition after information request is clear

Updates should state what is known, what is being checked, available workaround, and next update time. Do not claim root cause before confirmation.

Data handling

Case notes must exclude passwords, tokens, API secrets, private keys, full card numbers, and unnecessary personal data. If a secret is received, advise rotation. Sanitize logs before escalation.

Resolution criteria

Resolve when service is restored, the question is answered, an accepted workaround exists, or a tracked product defect owns the remaining work with customer agreement. Closure should summarize outcome and preventive customer action.

Routing scenarios

Invoice increased after adding seats: Billing. **API returns 503 and checkout is down:** Technical, with production impact driving priority. **Paid invoice but cannot log in:** Billing verifies suspension/payment state, then Support handles authentication. **Customer requests outage compensation:** Technical confirms impact window; Billing decides eligibility and amount.
